

## **About the Book**

*Other than municipalities, various industries disposing off the industrial effluents are the worst polluters of the aquatic resources. The increasing use of fresh water as raw material in various industrial applications has also accelerated the demand for high quality drinking water.*

*It is utmost importance, hence to prevent the pollution of aquatic resources by all possible means to control its quality from quality further deterioration. Applying microorganisms for industrial pollution is an area all over the world. To-day environmentalists are greatly concerned about the sustainable development and pollution control for restoration of wholesomeness of natural resource and to maintain ecological balance. Various treatment technologies in different combinations of physical, chemical and biological methods are in use to treat the industrial effluents of different origin in the present volume, various microbiological methods and the possible solutions for treatment and remediation of the effluents of different nature are described and discussed at length.*

### **Contents:**

- 1. Microalgae mediated remediation of waste water*
- 2. Sustainability of algal variables for bioremediation of industrial effluents containing heavy metals*
- 3. Abatement of metals pollution by microorganisms*
- 4. Microbes in extreme environment and their potential*
- 5. Role of microbes in remediation of industrial effluents*
- 6. Microbial potential in bioremediation of industrial effluents*
- 7. Piriformospora Indica: a plant stimulator and pathogen inhibitor arbuscular mycorrhiza-like fungus*
- 8. Operon mediated resistance to mercury and organomercurials in bacteria*
- 9. molecular mechanism of chlorinated pesticide degradation in microbial systems*
- 10. Microbial degradation of the poly chlorinated biphenyls presented in the environment: critical appraisal*
- 11. Removal and recovery of chromium from aqueous solution and industrial effluents by microorganisms and other non-conventional biosorbents*
- 12. Environmental terms, associated laws and their description*
