

About the Book

This book provides a rational and conceptual framework to appraise the wide range of renewable biomass for alternate energy options and to ascertain where each fuel option is most alluring. It also provides the possibilities of the intervention to expedite the effective implementation of production and utilization of renewable biomass as an alternative source of energy option particularly in this energy transition period. The prime aim is to propose a ready reference for technologies and policymakers who need instant and dogmatic guide for the fast developing field green fuel technology.

Contents:

- 1. Present strategy on biomass energy conversion technology*
- 2. Biological hydrogen production*
- 3. Bioremediation of organic wastes and biogas production technology*
- 4. Fuel wood farming and petrocrop biomass processing*
- 5. Biomass Gasification*
- 6. Biomass pyrolysis*
- 7. Biomass Liquefaction*
- 8. Future prospects*
